

EquityIQ Frontend Blueprint v1.0

Product Design & Frontend Architecture Specification (Lean Edition)

This document serves as the design blueprint for Milestone 10. It defines the product vision, design constraints, technical stack, and phased implementation strategy. It intentionally avoids prescribing pixel-perfect designs so that Antigravity can propose solutions within clearly defined boundaries.

1. Product Vision

Build EquityIQ as a premium AI-assisted Financial Intelligence Platform. The interface should feel comparable to modern SaaS products while remaining trustworthy, minimal, explainable, and data-first.

2. Design Philosophy

Professional Minimalism with Intelligent Motion. Prioritize clarity, consistency, whitespace, and meaningful micro-interactions over visual complexity.

3. Theme Guidelines

Light and dark themes must be visual counterparts. Never use a pure white application background. Use layered blue-gray surfaces, white cards, and a consistent accent palette.

4. Shared Visual Identity

Reuse a subtle financial background motif (graphs, node networks, valuation curves, grids) on low-density pages such as Login, Register, Empty States, and Settings.

5. Technology Stack

Next.js App Router, TypeScript, Tailwind CSS, shadcn/ui, Lucide React, React Hook Form, Zod, TanStack React Query, Framer Motion, Recharts, TanStack Table, react-markdown, next-themes, Sonner, date-fns.

6. Engineering Rules

Prefer mature libraries over custom implementations. Build reusable components, centralize design tokens, avoid duplicated logic, and maintain strict typing.

7. Frontend Architecture

Feature-first folder structure, shared UI library, centralized API client, React Query for server state, minimal local state, theme provider, reusable layouts.

8. Development Workflow

Each phase follows: Implement → Review → Refine → Freeze → Next Phase. Never work ahead without approval.

Milestone 10 Implementation Phases

- 1 **Phase 1:** Authentication (Login, Register, Forgot Password, Theme Toggle, Shared Auth Layout)
- 2 **Phase 2:** Application Shell (Sidebar, Topbar, Routing, Command Palette, Theme System)
- 3 **Phase 3:** Dashboard (KPIs, Charts, Activity, AI Insights)
- 4 **Phase 4:** Company Workspace (Overview, Financials, Documents, Search)
- 5 **Phase 5:** Financial Intelligence (Ratios, Trends, Risks, Explainability)
- 6 **Phase 6:** AI Chat (Grounded Responses, Citations, Confidence, Sources)
- 7 **Phase 7:** Reports (Viewer, Streaming, Export)
- 8 **Phase 8:** Workspace & Settings (Profile, Notifications, Preferences)

Acceptance Criteria

Every phase must be responsive, accessible, production-ready, reusable, type-safe, visually consistent, and verified before moving to the next phase.

Guidance for Antigravity

Do:

- Build reusable components before feature pages.
- Use ecosystem-standard libraries whenever appropriate.
- Keep styling centralized through design tokens.
- Maintain identical layouts across light and dark themes.

Don't:

- Reinvent common UI components.
- Create 100+ line custom implementations where a library exists.
- Hardcode colors or duplicate layouts.
- Proceed to the next phase until the current phase is approved.
